I had Fable add GodotSteam to my game and multiplayer just WORKS

Discussion

It's insane, the "Add Multiplayer" button people always joked about is real for Godot now. I did my best to make this game from the ground up with Fable to allow for multiplayer, it is a 3d combat game like Chivalry so hitboxes and hurtboxes have to sync and there are physics objects everywhere, and it just WORKS! It's crazy. I've spent so long designing systems and thought multiplayer would break everything but I can literally just click "Host Multiplayer" In my pause menu and any of my steam friends can join me now if they have the .exe, and it felt like magic. No port forwarding, no external tools (other than steam I guess)

I had no idea this was a thing. Sounds really good for testing and developing a game.

In godot at least, worked super well. Fable did all the fancy back end stuff and handled plugging it into my existing code.

So steam is handling the multiplayer stuff?

you might want to take a look at your network footprint. GodotSteam only is a transport layer, and there is a half decent chance that AI is using RPCs replicating dictionaries for game state. It might be doing things smarter (I had an older AI model take a shot at networking a while back, but I don't know how well the new ones do), but if you built the game systems for local play first, it would need to rewrite a ton of your code to get a tick loop and put your gameplay through it.

Of course, the network footprint is only a concern if you plan to host servers on the cloud.

Also, if you're making a game as fast paced as Chivalry, you'll need prediction+rollback and possibly input delay to mask the latency (reconciliation on action games looks bad).

Yes steam has a relay server that devs use, set up multiplayer manually in godot years ago it takes like 5 minutes, super easy

**BertJohn** • 16h ago

Also works in unity with ChatGPT 5.5 too~
